Skills

Programming Languages:	Java, C++, Python, Javascript, Scala
Programming Related Skills:	HTML, Windows, Linux, Microsoft Office, Sqlite3
Relevant Coursework:	Discrete Mathematics, Digital Systems, Data Structure and Algorithms
Relevant Coursework(2):	Programming Languages, Data Oriented Computing for Mathematics
Relevant Coursework(3):	Introduction to Scientific and Mathematical Computing

Projects

Unnamed Restaurant POS System *Java, Python*
A personal project that is currently in progress that seeks to create a program that restaurant owners can use to manage thier point-of-sales efficiently with simple UI. The finished product will incorporate web/server connection, app/mobile compatibility, integrated with a receipt printer, and data storage for analytics.

Unnamed Astronomy Project *Python, SQL*
A course project that is currently in progress that involves making an SQL query to single out a portion of the sky given specific right ascension and declination.. This query provides a listing of all celestial objects in that portion of the sky. Then, provided with a smaller sample size of the collected region by the user, the region can be inverted,flipped, transformed in anyway. The algorithm will find the celestial bodies in the overarching region that correspond to the transformed regions.
